Four in ten orders are cancelled or returned, and the other patterns are small

Total Orders	Total Order Value	Cancel/Return %	Net Order Value
1.200K	1.265M	41.42%	745.088K

What 1,200 orders tell us about product, channel and trend.

Key findings:

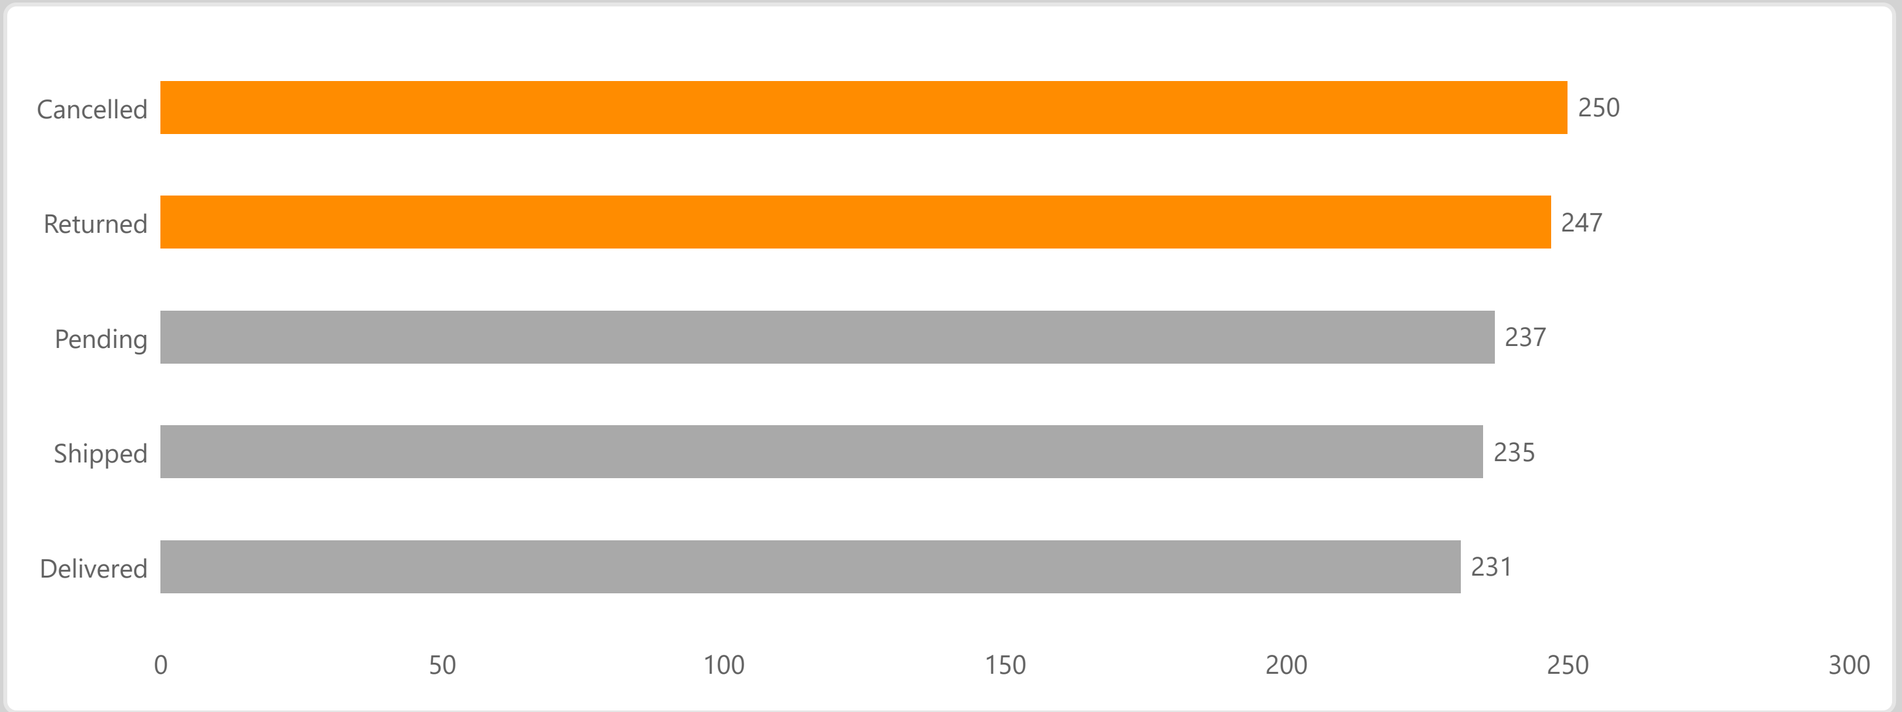

1. 41% of orders were cancelled or returned; the data does not say why.
2. Product mix is balanced: each product is 12% to 15.5% of order value.
3. Channel gaps are about 7% and may be chance.
4. Quarterly order value is down since 2023, but the evidence is borderline.

Next steps:

- Record a reason for every cancelled or returned order.
- Don't move spend between products or channels on these gaps alone.
- Watch the next few quarters before acting on the decline.

Source: Orders_Clean, all 1,200 orders. Net order value excludes cancelled and returned orders. Details and caveats are on the pages that follow.

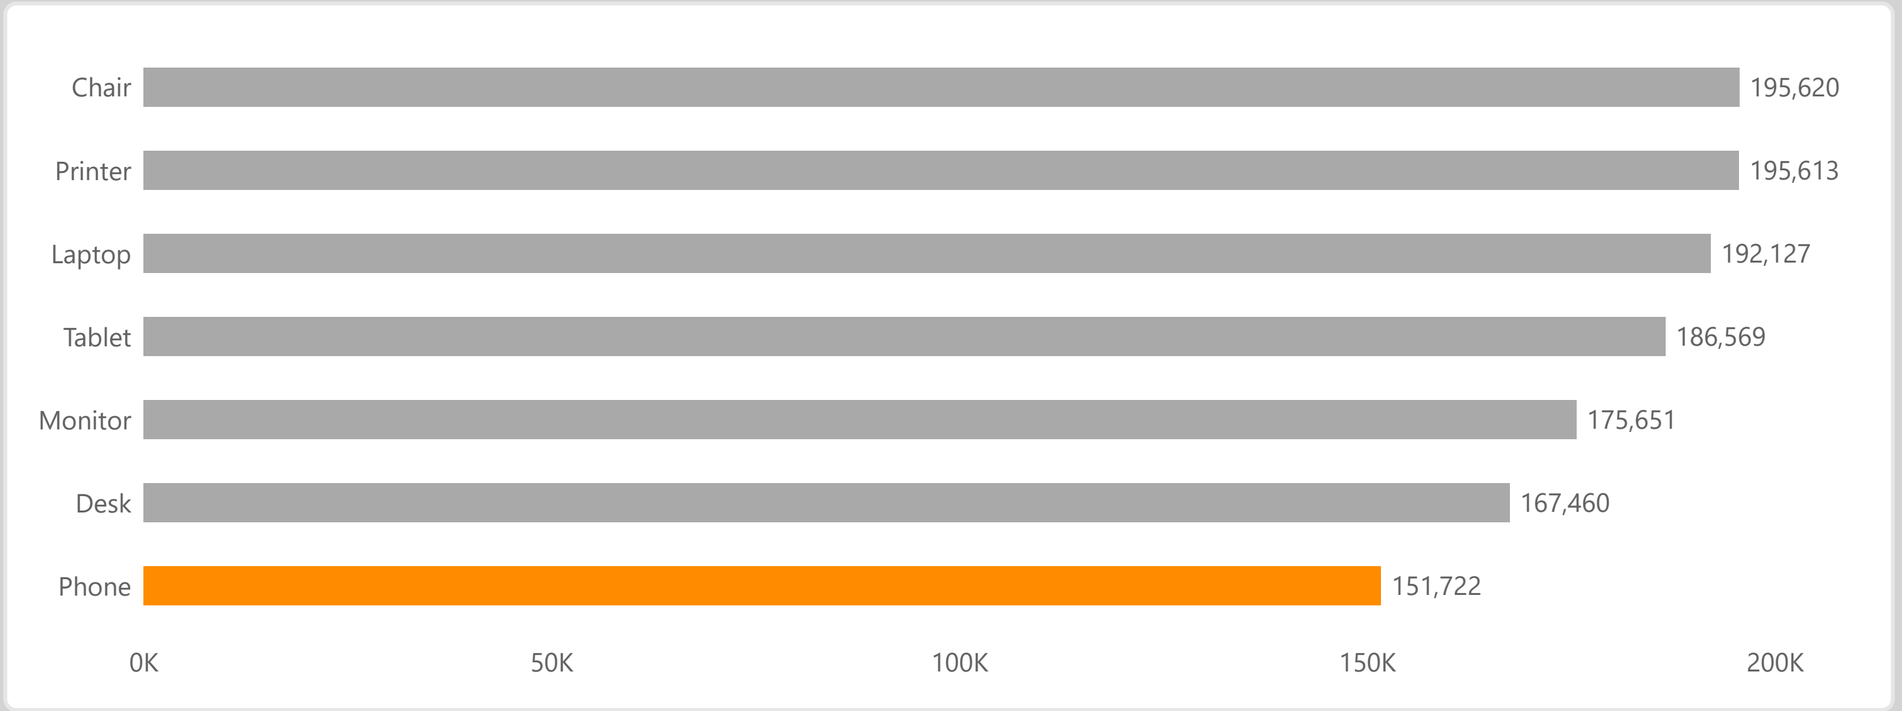

41% of orders were cancelled or returned; only 39% shipped or delivered.

So what? Four in ten orders were cancelled or returned, and the data does not say why. Finding out is the next step.

Source: Orders_Clean, 1,200 orders. Cancelled + Returned = 497 (41%); Shipped + Delivered = 466 (39%); Pending = 237 (20%). The dataset does not record why orders were cancelled or returned.

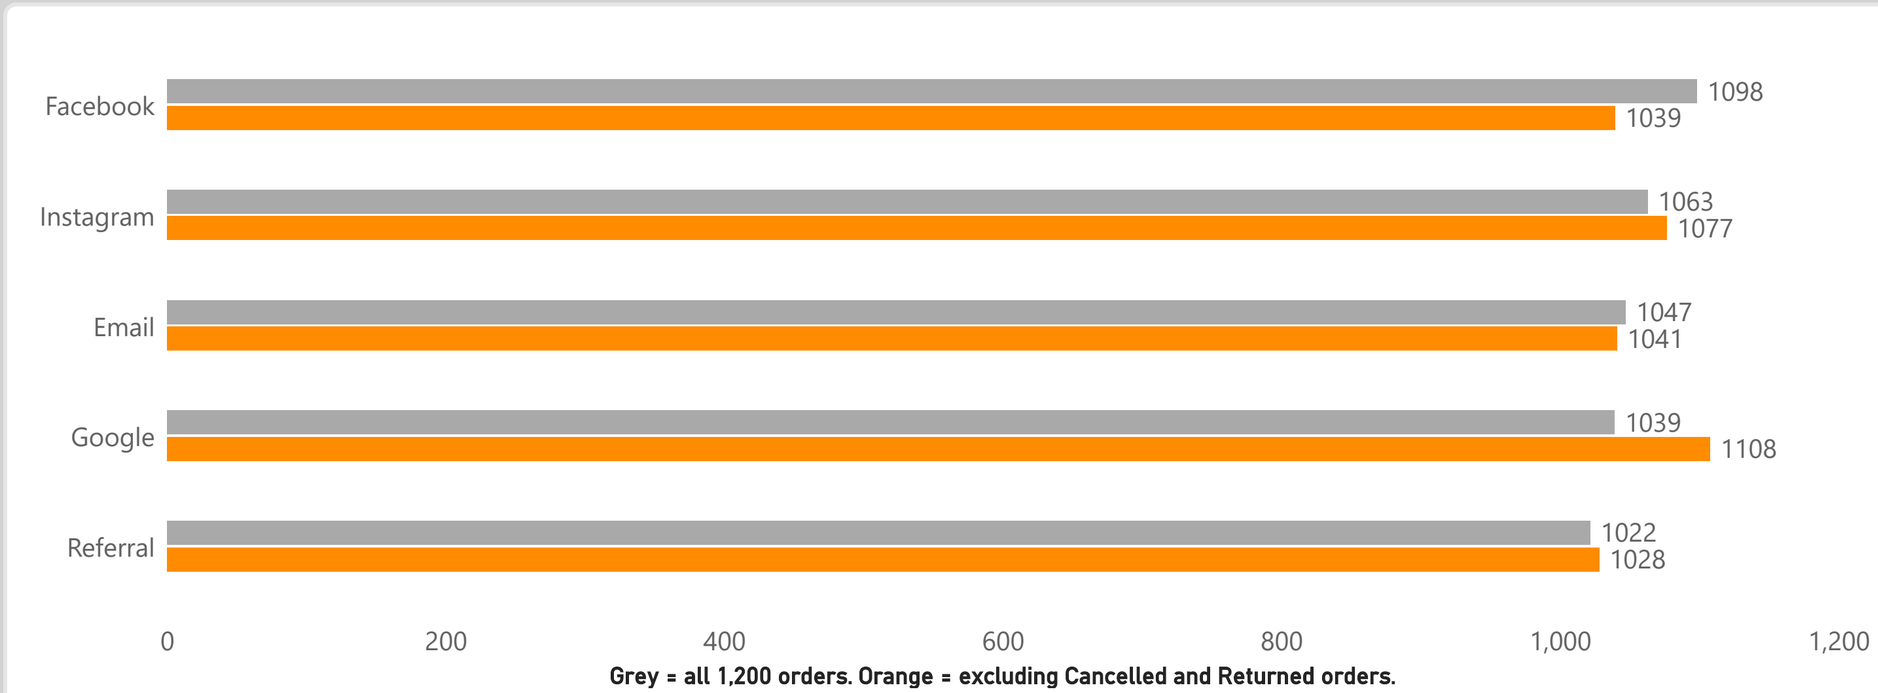

No product dominates: each brings 12% to 15.5% of total order value, and Phone is the smallest.

So what? Product mix looks balanced; the bigger question is the 41% of orders that were cancelled or returned.

Source: Orders_Clean, all 1,200 orders; total order value includes Cancelled and Returned orders. Excluding them, Phone is still the smallest, but within individual order statuses the smallest product varies.

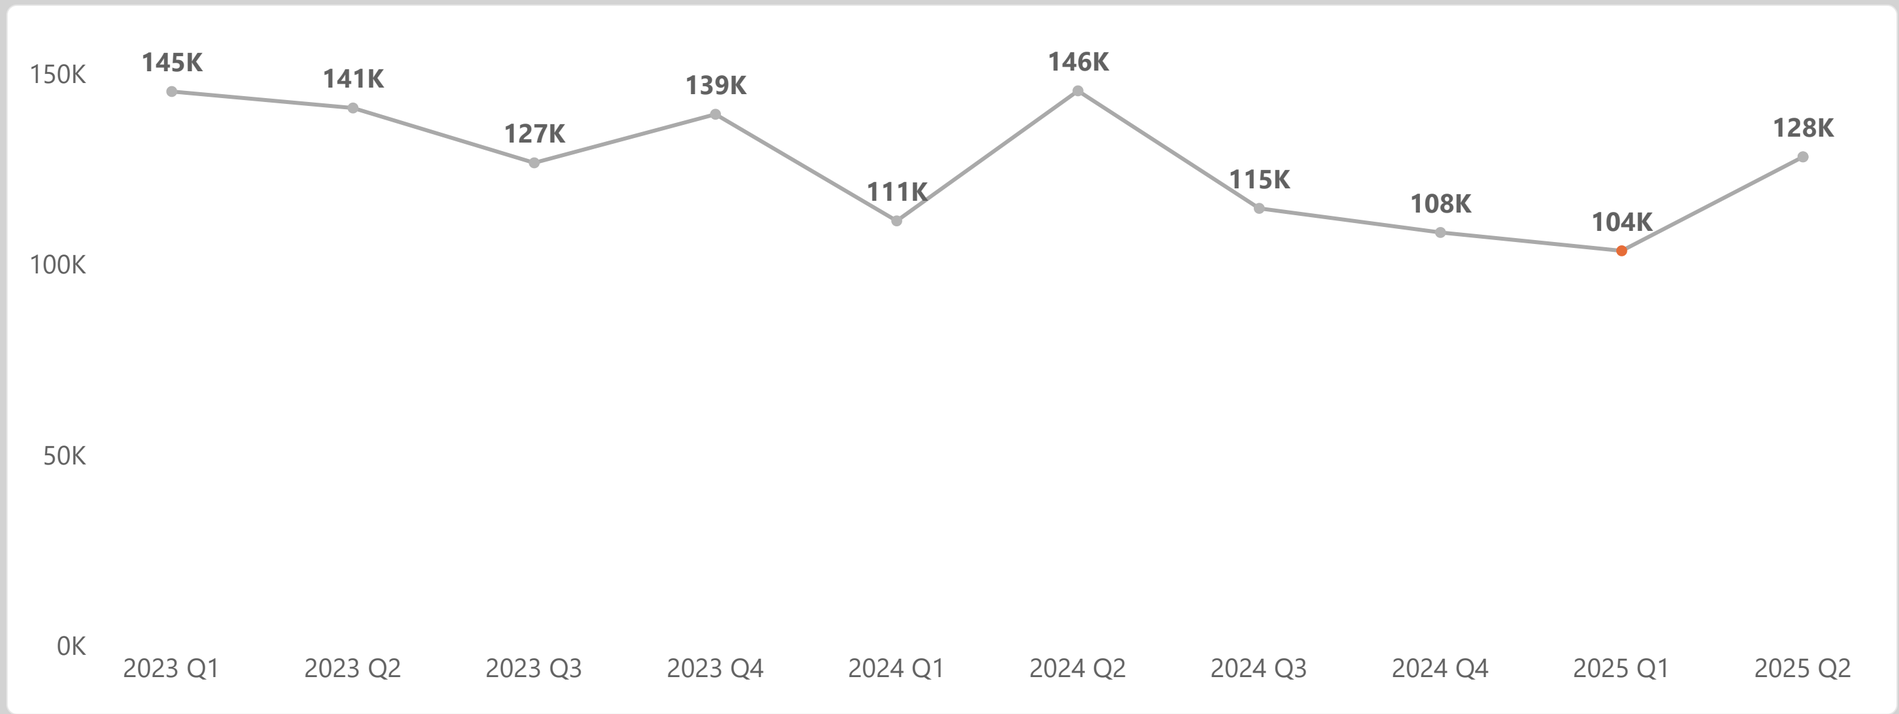

No channel clearly wins: the highest average order value switches from Facebook to Google once cancelled and returned orders are excluded.

So what? Don't move marketing spend on these numbers alone: the ranking changes with the order mix, and the gaps could be chance.

Source: Orders_Clean. Average order value per channel. Channels differ by only about 7%, and a statistical test found no evidence the gaps are more than chance.

Quarterly order value has drifted down since 2023, but the evidence is borderline.

So what? Treat this as a question to watch, not a conclusion: check the next few quarters before acting on it.

Source: Orders_Clean, all 1,200 orders. January to June order value fell from 286,502 (2023) to 257,059 (2024) to 231,883 (2025), about 10% a year. Statistical tests on the trend are borderline.
